V2 - second trifoliate Soy

Which of the following best describes current conditions in this county?

Mildly Wet (soil is wetter than normal, local vegetation is healthy)

Quick synopsis of conditions that will appear in the main feed

A dryer weather pattern allowed most to finish or nearly finish planting or replanting. Earliest planted corn is near or at V6 and earlier planted soy is now V3. We encourage early scouting of fields, including replant areas to evaluate crop emergence (note soy replant seedling feeding in picture), weed pressure and height. Expecting post corn herbicide applications to start soon.
