**County**

St. Clair

**Region/State**

Region 6

**Which of the following best describes current conditions in this county?**

Mildly Wet (soil is wetter than normal, local vegetation is healthy)

**Quick synopsis of conditions that will appear in the main feed**

In St. Clair county, just about all of the corn has been planted, including some replants. Most corn is in V2-V4 range with a few outliers at V6. The majority of the first crop soybeans are in the ground, and I'd venture to say that by the end of the week the rest will follow. Most soy fields are VE-VC with a couple of outliers at V1-V2.

Over the past week wheat harvest has started across the Route 50 corridor and is well underway farther south. Some early reports show that despite fungicide application, the wet weather this spring has reduced yields below the expectations of early scouting reports. I'm sure by next week we will have a much fuller picture of that situation.
