Possible *Septoria glycines* (Brown Spot) on lower leaves of soybeans

Which of the following best describes current conditions in this county?

Moderately Wet (soil is damp, standing water may be present in low areas, water bodies are full)

Quick synopsis of conditions that will appear in the main feed

Widespread precipitation across the area has been a big benefit to the crop. Most of central IL did not have much reported damage from the derecho on the night of the 15th. Rain amounts varied, but most of the area received some much needed rain from Beryl and the storms following. Now to keep our eyes on what could be optimal conditions for disease progression especially considering that the planting dates are wider than normal.
