Soybean field at R7 (beginning maturity)

Which of the following best describes current conditions in this county?

Near Normal

Quick synopsis of conditions that will appear in the main feed

The corn and soybean crop in McLean County is looking good as many fields are nearing maturity. All corn fields surveyed were somewhere in the R5 (dent) stage with full ears, although a couple fields showed some bare ear tips. Low to moderate levels of stalk rot symptoms were visible in several fields surveyed. Minimal corn foliar disease was observed, although tar spot was found at low levels in a couple fields in the north and eastern parts of the county. The majority of soybean fields surveyed are in the later half of R6 (full seed), but a number of fields in the county are progressing into R7 (beginning maturity). Soil moisture conditions were good, with no standing water observed but moisture available at or just below the surface in fields surveyed.
